HEALTH DEPARTMENT, TOWN HALL,

SUNDERLAND.

TO THE CHAIRMAN, VICE-CHAIRMAN, AND MEMBERS OF THE HEALTH COMMITTEE.

GENTLEMEN,

I have the honour to submit to you the Report on the Health and Sanitary Condition of Sunderland for the year 1910, being my Seventh Annual Report.

It is gratifying to find that the health of the Borough continues to improve, as shown by a succession of falling death-rates, the rate for the past year being 15.8 per 1,000 of the population, calculated on the estimated population for that year. No method of estimating the population of a community, which is free from error, has yet been devised. That now in general use by Medical Officers of Health, is worked by geometrical progression, and assumes that the population has gone on increasing or decreasing since the last census at exactly the same rate that it did between that and the previous census. Whilst my report is in the Press, I find that the provisional figures of the census for 1911 have been returned, the population of Sunderland on April 2nd, 1911, being given as 151,162. For statistical purposes the Registrar-General estimates the population to the middle of the year. My estimate for the year 1910, taken to the middle of the year, was 160,785. Thus there has been an over-estimation of probably ten thousand. I cannot say definitely as I have not yet had time to make the necessary calculations.

There must have been a very large number of people who have emigrated during the last ten years, for if we add the excess of births over deaths during that period to the census population of the year 1901, we find that the figure is 166,744.

Thus, Census population 1901 = 146,077Add excess of births over deaths

during inter-censal period = 20,667 166,744

However, even with a population of less than 151,162 at the *middle* of the year 1910, I am of opinion that when the calculation is made, our death-rate for that year will be very near 16.8 per 1,000, and if so, still the lowest on record for the Borough.

I beg to draw your attention to a number of Charts which I have introduced into this Annual Report, showing various statistics in graphic form, relating to the health of the Borough.

I have to thank the Chairman, Vice-Chairman, and Members of the Health Committee for their courtesy and help in the administration of the work of the Department during the year.

I am, Gentlemen,

Your obedient Servant,

HENRY RENNEY,

Medical Officer of Health.

May, 1911.

COUNTY BOROUGH OF SUNDERLAND.

HEALTH DEPARTMENT.

ANNUAL REPORT

FOR THE YEAR 1910.

POPULATION.

The population, estimated to the middle of 1910, was 160,785 being an increase of 1,648.

The population is an estimation based on the Census Returns. This estimate is liable to error; indeed it is never quite accurate, and it would greatly facilitate a correct return of the population for each inter-censal year if the Census were taken every five years instead of every ten as at present.

Table A shows the estimated population in each of the three registration sub-districts of the Borough, the area of these districts, and the number of people per acre.

TABLE A.

	Population.	Area in Acres.	Density of Population per Acre.
Sunderland East	59,468	897	66.3
,, West	66,076	1,724	38.3
,, North	35,241	736	47.9
Borough	160,785	3,357	47.9

Table B shows the Age and Sex Distribution (estimated to the middle of the year). For instance, taking line No. 1—there were in 1910 estimated to be 4,642 persons living under the age of 1 year, of whom 2,311 were males and 2,331 females.

TABLE B.

At Ages	Persons.	Males.	Females.
Under 1 year 1 to 5 years 5,, 10,, 10,, 15,, 15,, 20,, 20,, 25,, 25,, 30,, 30,, 35,, 35,, 40,, 40,, 45,, 45,, 50,, 50,, 55,, 55,, 60,, 60,, 65,, 65,, 70,, 70,, 75,, 75,, 80,, 80,, 85,, 85 and Upwards	4642 15291 16801 16642 17039 16570 14713 11541 10276 8174 7701 6204 5259 3873 2621 1799 945 554 140	2311 7719 8412 8444 8206 7667 7118 5615 5053 3808 3820 3249 2771 1892 1261 841 454 178 53	2331 7572 8389 8198 8833 8903 7595 5926 5223 4366 3881 2955 2488 1981 1360 958 491 376 87
Totals	160785	78872	81913

CENSUS POPULATION.

The Census population of 1901 was 146,077; 71,533 being males, and 74,494 females.

The Census populations of the various Wards were as follows:—

Bishopwearmouth	9,964	Monkwearmouth-Shore	10,709
Bridge	12,944	Pallion	8,560
Central	9,433	Park	9,643
Colliery	8,179	Roker	6,975
Deptford	10,501	St. Michael's	8,098
East		Sunderland	9,829
Hendon	5,750	Thornhill	9,230
Monkwearmouth	5,869	West	10,869

MARRIAGES.

The number of Marriages registered in the Registration District of Sunderland (which, in addition to the Municipal Area, includes the Townships of Ford, Tunstall, Ryhope, Fulwell, Southwick, and Hylton), during each of the past ten years is as under:—

	1	No. of			N	o. of
Year.	${ m M}arepsilon$	rriages.	Y	Tear.	Ma	rriages.

1904	• • • • •	1,545	}	909	•••••	1,412
1905	• • • • •	1,572	1	1910		1,530

BIRTHS.

The Births registered during the year 1910 numbered 4,582 the birth-rate being 28.5 per 1,000 of the population, being the lowest yet recorded.

The number of Births in 1910 shows a decrease of 183 as compared with that of the previous year, and the Birth-rate is 0.9 lower. The rate is 3.5 per 1,000 higher than the average Birth-rate of the 77 large towns. It has been falling for the last nine years.

The Birth-rates during the 1st, 2nd, 3rd, and 4th quarters were 27.0, 30.5, 29.2, and 27.2 per 1,000 respectively.

The Birth-rate in the 77 large towns of England and Wales was 25.0 per 1,000 of the population.

Table showing the number of Births of Males and Females, together with the Birth-rates for the 10 years, 1901 to 1910:—

TABLE C.

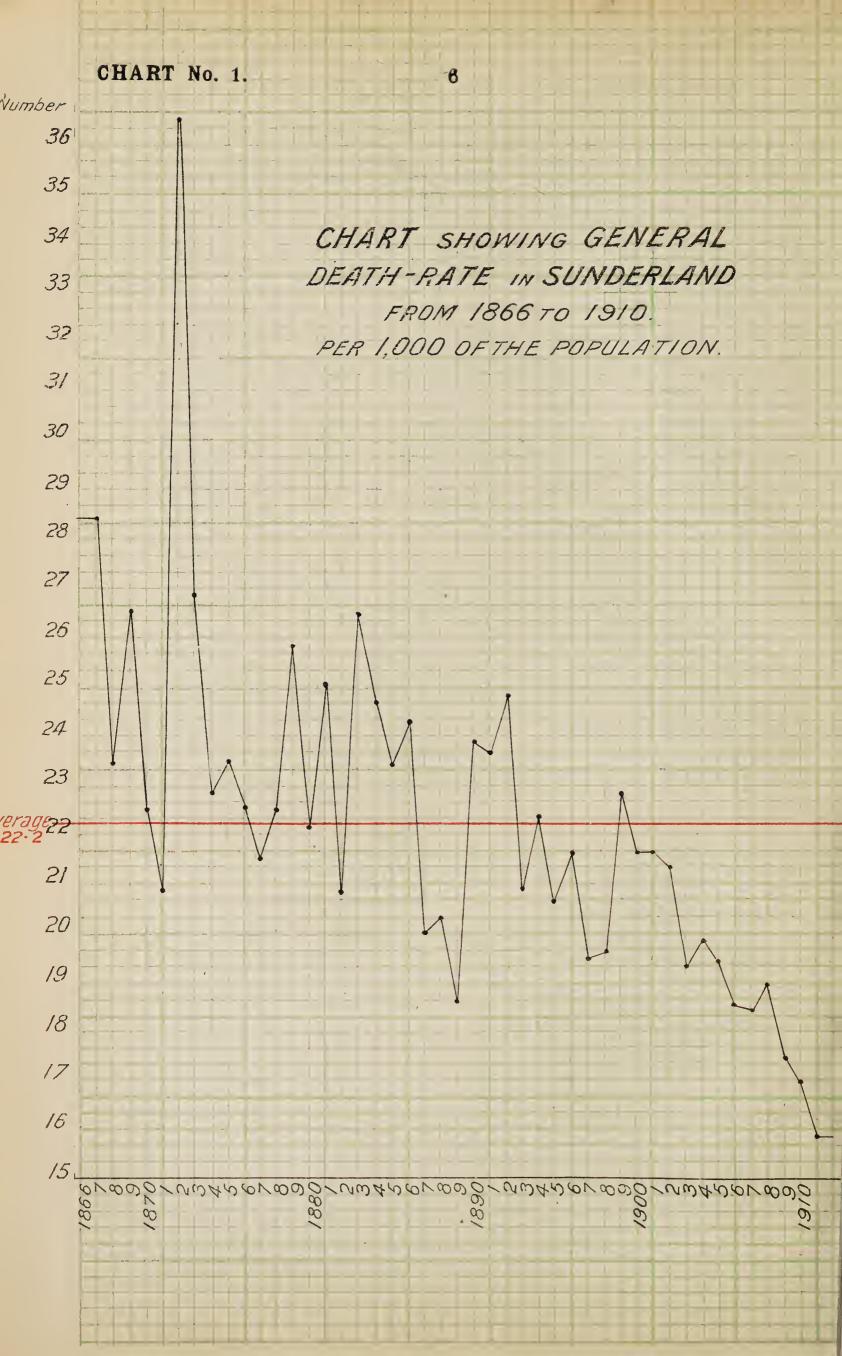

T 7 - 2 - 2	В	Births Registered.				
Year.	Males.	Females.	Total.	Rate.		
1901	2588	2691	5279	36.0		
1902	2742	2649	5391	35.7		
1903	2598	2597	5195	34.5		
1904	2654	2540	5194	$34 \cdot 3$		
1905	2615	2608	5223	34.2		
1906	2786	2589	5375	34.8		
1907	2746	2584	5330	34.2		
1908	2628	2552	5180	32.9		
1909	2493	2272	4765	29.4		
1910	2337	2245	4582	28.5		

FEMALES AT CHILD-BEARING AGE.

For comparison for Birth-rates it is more important to know the number of children born per 1,000 women at child-bearing age, than the number born per thousand of the population. The following Table is an estimation of the number of females living in Sunderland at child-bearing years, for the last ten years, (calculated from the Census Returns for the years 1891 and 1901), and the number of children born in each year:—

YEAR.	Estimated Number of Women at Child-bearing age.	Number of Children Born.	Number of Children Born per 1,000 Women at Child- bearing Age.
1901	36269	5279	145
1902	36709	5391	147
1903	37154	5195	139
1904	37605	5194	138
1905	38062	5223	137
1906	38755	5375	138
1907	39197	5330	136
1908	39683	5180	130
1909	40252	4765	116
1910	40846	4582	112
		1	

THE DEATH-RATE.

It is satisfactory to have again to record a low death-rate. In 1909 it was 17.0 per thousand—for the year 1910 I have to report that the death-rate was 15.8 per thousand, being the lowest yet recorded in the history of the Borough.

The death-rates from 1873 to 1910 are given in the Table below, and are shown in graphic form on Chart No. 1, page 6, from 1886 to 1910. Here it will be seen what a great reduction in mortality has taken place, and how far we are below the average death-rate of these years.

The Deaths registered during the year (including the deaths in the Borough Asylum) numbered 2,548.

The following Table gives the Death-rate per 1,000 since 1873:—

Death-Rates per 1,000 of the Population (1873—1910).

		Rate per			Rate per.]	Rate per
Year.		1,000	Year.		1,000	Year.		1,000
1873		22.7	1886		20.0	1899		21.7
1874	• • (23.6	1887	• • •	20.3	1900	• • •	21.7
1875		$22 \cdot 4$	1888	• • •	18.7	1901		21.3
1876		20 ·8	1889_{\pm}		23.9	1902	• • •	19.3
1877		$22 \cdot 5$	1890		23.7	1903	• • •	19.8
1878		25.5	1891		24.8	1904		19.4

Typhoid Fever	11	0.06	,,	0.03	,,		
Puerperal Fever	5	0.03	,,	0.09	,,		

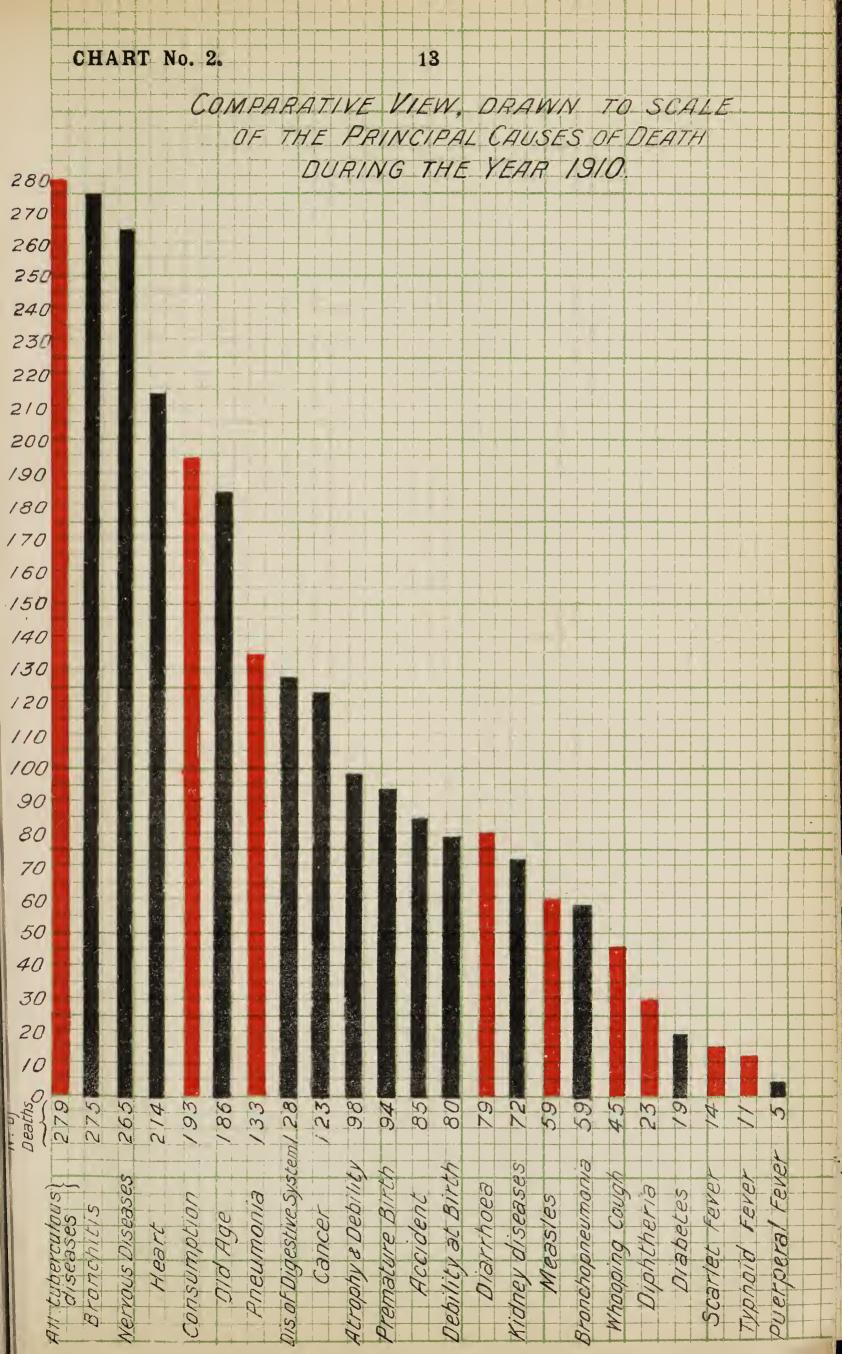

^{* &}quot;Diseases of the Digestive System" includes Diseases of the Pharynx, Oesophagus, Stomach, Intestines, and Liver, and also Peritonitis.

^{* &}quot;Nervous Diseases" includes Convulsions, Meningitis (not Tubercular Meningitis), Encephalitis, Apoplexy, Softening of the Brain, Hemiplegia, General Paralysis of the Insane, other forms of insanity, Chorea, Cerebral Tumour, Epilepsy, Laryngismus Stridulus, Locomotor Ataxy, Paraplegia, and other ill-defined diseases of the Brain and Nervous system.

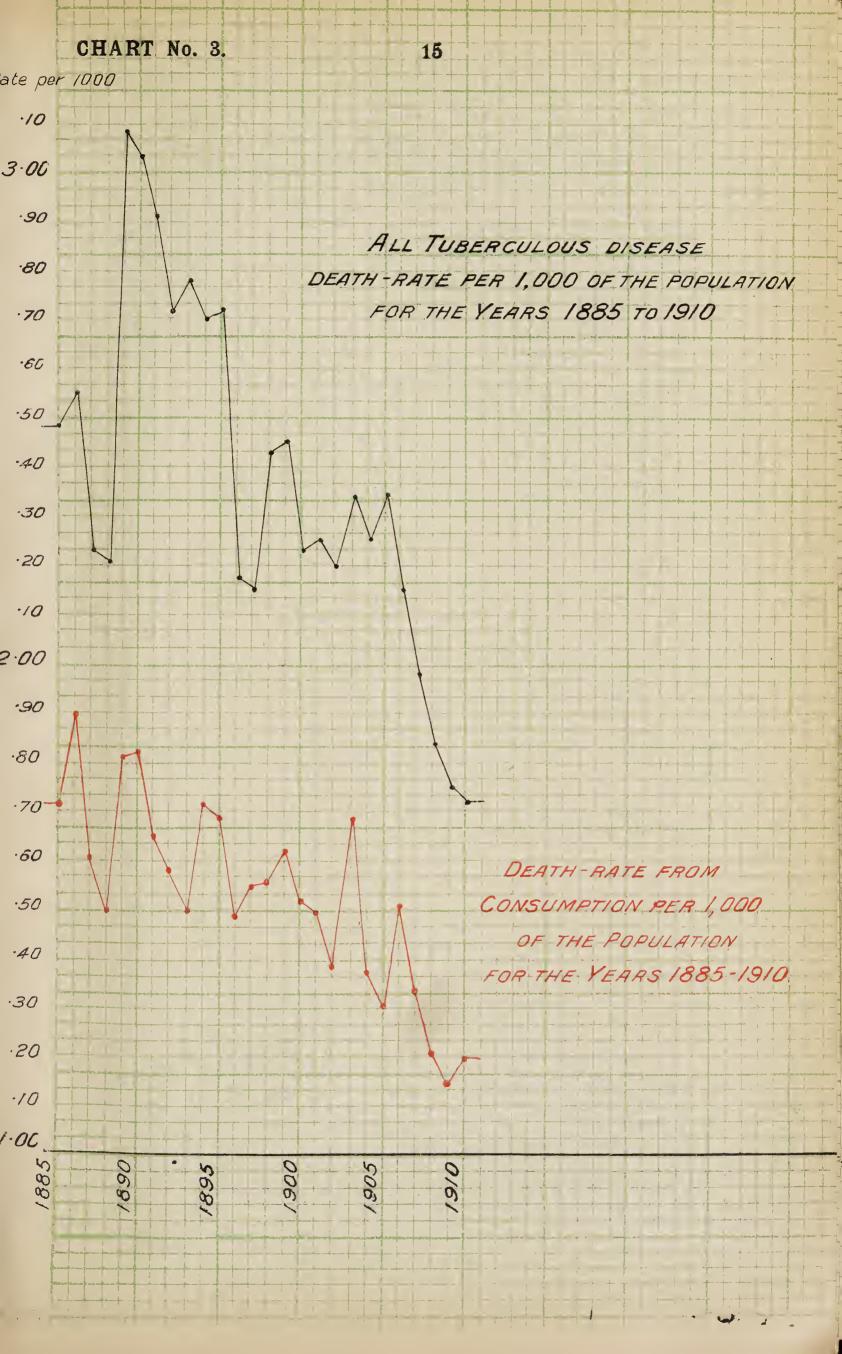

It is satisfactory to note that the Death-rate from all tuberculous diseases is decreasing, a steady fall in the curve having taken place commencing with the year 1905. This is shown on Chart 3, page 15. The Chart also shows a fall in the mortalityrate due to Consumption, for the years 1906 to 1909; in 1910, however, there is a slight rise, which I hope will not be maintained.

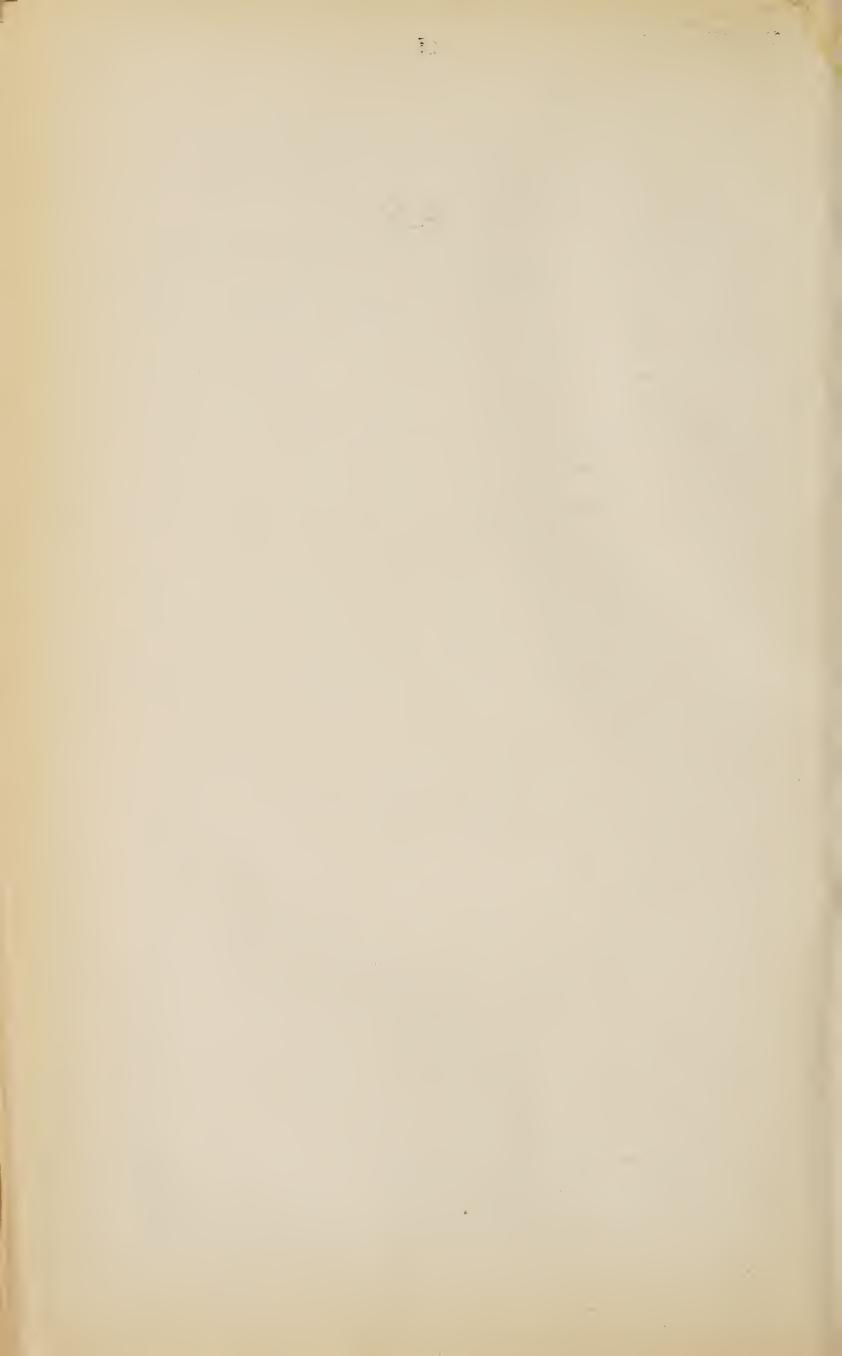

It is a matter for grave contemplation that the deaths due to Tuberculous diseases heads the list (See Chart 2, page 13).

The Death-rate for Bronchitis is lower than it has been since 1897, and the Death-rate for all Respiratory diseases (except Consumption) is the lowest since 1882, as is shown in Chart 4, page 17.

INFECTIOUS DISEASES.

SCARLET FEVER.

The following Table shows the number of cases of Scarlet Fever notified during the last ten years, the attack-rate, the fatality per cent. of cases, and the death-rate per 1,000 of the population.

YEAR.	No. of Cases Notified	Attack-rate per 1,000 of the population	Fatality per cent of cases.	Death-rate per 1,000 of the population .
1901	744	5.0	6.0	0-30
1901 1902	814	5·5	3.0	0.16
1903	758*	5.0	4.7	0.24
1904	198	1.3	1.5	0.02
1905	184	1.2	$0.\overline{5}$	0.006
1906	283	1.8	1.7	0.03
1907	498	$3 \cdot 2$	3.8	0.12
1908	325	$2 \cdot 0$	1.5	0.03
1909	596	3.6	$2 \cdot 6$	0.10
1910	432	2.6	$3\cdot 2$	0.08

*Milk epidemic.

The number of cases of Scarlet Fever whilst fairly large, did not reach the number reported in the previous year by 164; the fatality however, was slightly greater. It will perhaps not be without interest to turn up the records of former years with respect to Scarlet Fever; in doing so, it will be found that the years 1876 to 1882 show the following number of deaths from this disease, viz.:—133, 138, 186, 243, 312, 145, and 168, respectively. The deaths for the last seven years have not exceeded 19 in any separate year, and total 62 only for this period.

In 1910 there were 13 deaths from Scarlet Fever.

On pages 21 and 23 will be found Charts showing the Attackrate since 1885, the Death-rate, and the percentage of notified cases of Scarlet Fever sent to Hospital.

DIPHTHERIA.

There were 161 cases notified in 1910, causing 23 deaths and a consequent Death-rate of 14·3 per cent., which is 0·3 per cent. more than that for the previous year. The Death-rate per 1,000 of the population was 0.14. The Death-rate from this Disease in the 76 large towns varies from 0·02 to 0·33 per 1,000 of the population.

The following Table shows the case-mortality for the last 10 years:—

Year.	Case	Mortality.
1901	.38·1	per cent.
1902		21
1903	.33.0	2.9
1904	.36.4	22
1905		"
1906		22
1907		
1908	· -	"
1909		"
1910		"
1010	TT U	22

On page 27 I have introduced a Chart showing the rapid rise in the attack-rate of Diphtheria since 1899, and the fall from the year 1906 to the year 1910. Since 1907 there has been a nearly constant fall in the death-rate, which is shown by the red lines on the Chart.

I have not the slightest doubt that the fall in the Case-mortality, which was 44 per cent. in 1900, and now is only 14.3 per cent., is entirely due to the prompt use of Antitoxin, first supplied free to Medical Practitioners by the Corporation in 1900 for patients who were unable to pay for it.

WHOOPING COUGH.

This disease, though more prevalent than in the preceding year, was not nearly so much so as in 1908, when the fatality reached 0.75 per 1,000 of the population. The number of cases varies exceedingly in different years. The Chart on page 29 shows the death-rate due to this disease, for the years 1873 to 1910. There is no doubt that the number of cases could be much diminished if parents of those having the custody of young children would cease exposing them to infection.

TYPHOID AND CONTINUED FEVER.

If there is one thing more than another on which the Health Committee are to be congratulated, it is the diminution in the number of cases of Typhoid Fever and Continued Fever. In 1910 there were only 60 cases notified—ten years ago there were 266 cases notified.

BACTERIOLOGICAL EXAMINATION FOR DIPHTHERIA COMMENCED, FEB. 1899 ANTITOXIN SUPPLIED TO MEDICAL PRACTITIONERS SEPT, 1900.

FOR THE YEARS

1885 - 1910.

.

The death-rate from this disease in 1910 was only 0.06 per 1,000 of the population, being the lowest on record. The attack-rate and death-rate for the years 1886 to 1910 are shown on Charts 9 and 10, pages 33 and 35. These Charts show an almost unbroken fall in the attack-rate, while that of the death-rate is most gratifying.

The case-mortality was 18.9 per cent.

The following Table gives the number of cases of Enteric and Continued Fever notified at different age-periods.

MALES.									
0-1	1–5	5-15	15–25	25–35	35–45	45–55	55-65		
•••	6	11	8 3		3	2	1		
FEMALES.									
						,			
0-1	1-5	5–15	15-25		35–45	45-55	55-65		

3 cases were notified in January. February. 1 case was March. 3 cases were April 3 May. 1 case was June. 6 cases were July. 6 August. September. 18 October. 5 November 4 December. 6

The following were the occupations of those notified.:—

Under School Age	4	Miner	2
No Occupation	6	Assistant in Fish Shop	l
Caulker	1	Domestic Service	1
Forgeman	1	Milliner	- 1
Plater	2	Sawyer	1
Rivetter	1	Screener at Colliery	-1
Housewife	6	Labourer	5
Sea-going Engineer	. 1	At School	24
Ropeworker	2	Total	60

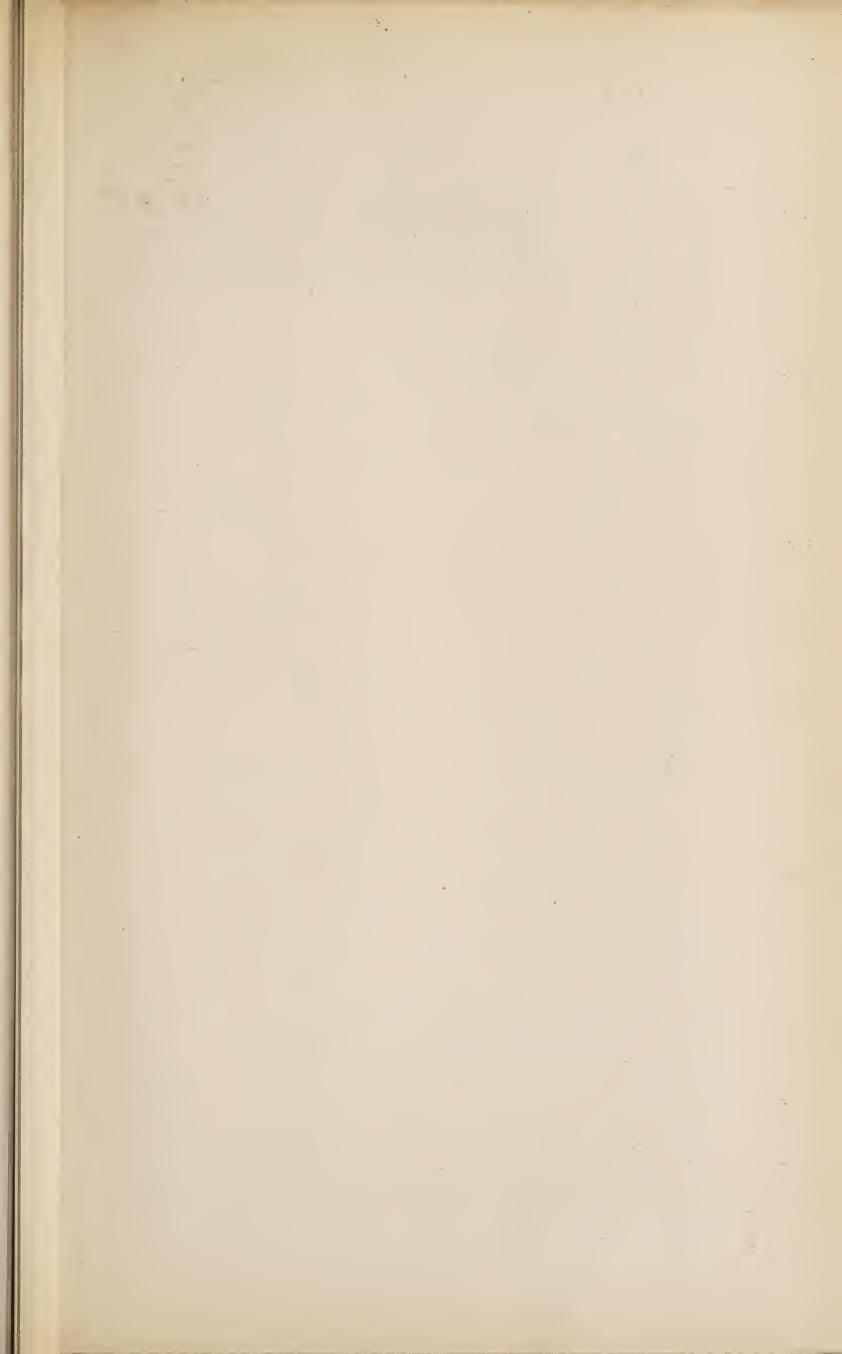

Six Schools had two cases each, in the remainder of the Schools affected, there was only one case in each.

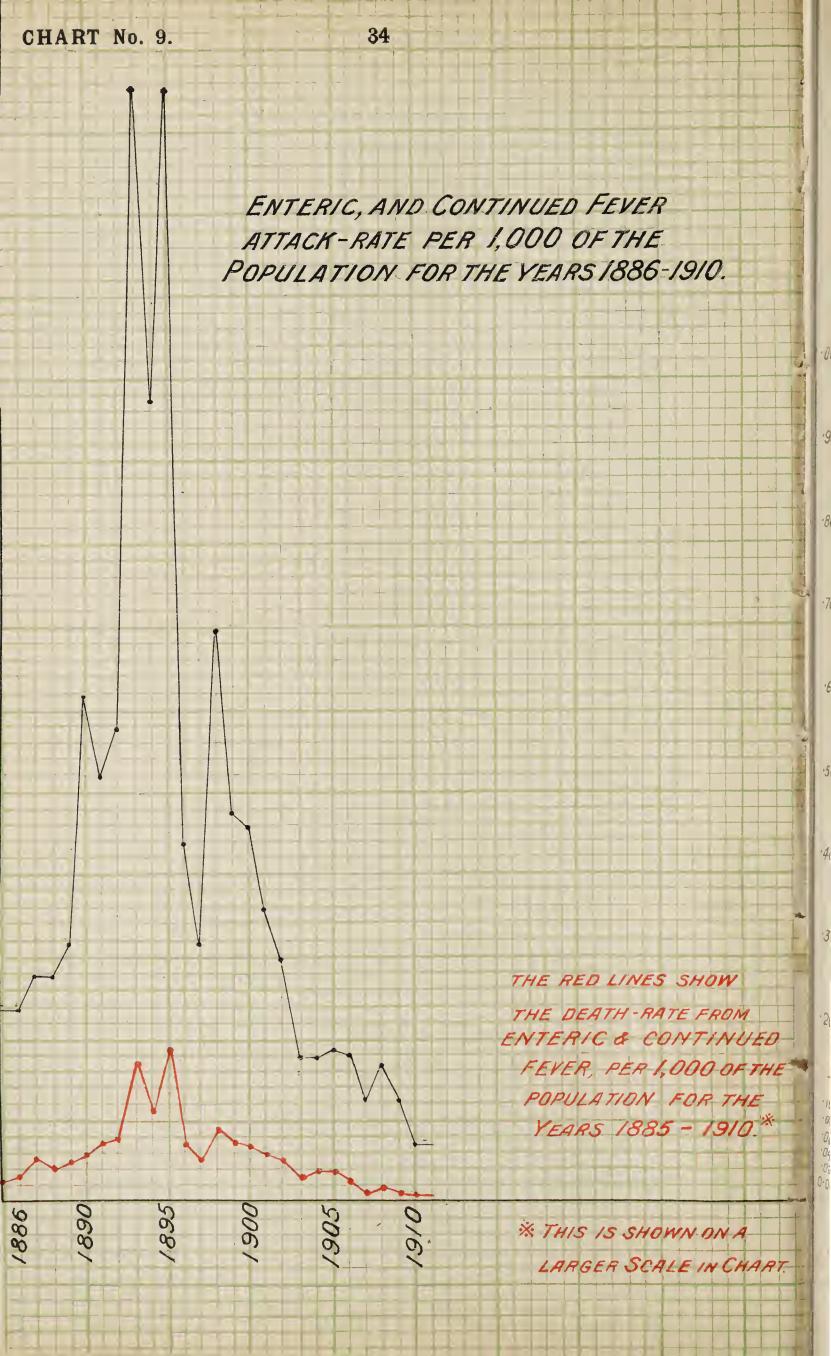

The Milk supply did not appear to be involved; in 16 cases, Condensed Milk had been used; the remainder were supplied by 28 different Dairies.

57 Cases were treated at the Borough Sanatorium, and 3 at home.

On extended observation of the 57 cases treated at the Borough Sanatorium, it was found that 17 of these were not suffering from Typhoid Fever but from some disease simulating it. Thus there were only 40 cases, making with the 3 home-treated cases, a total of 43 for the Borough during the year.

Typhoid Fever is often difficult to diagnose from certain other diseases, and therefore every infectious diseases hospital receives a large percentage of cases which turn out not to be Typhoid. It is better, in my opinion, that these suspicious cases should be sent to our Sanatorium rather than that they should eventually prove to be Typhoid and probably be the cause of further cases in the Borough. The source of the infection is nearly always difficult to obtain for various reasons; some patients do not give very clear answers to queries as to the source apparently from a vague fear of blame being attached to themselves, which of course is absurd; others do not remember any possibility of infection, and this is not to be wondered at when one recollects that the incubation

period extends to about three weeks. In the cases notified, as suffering from Typhoid Fever during the year 1910, two had eaten Mussels within a period corresponding to the length of the incubation; in two cases there had been a previous one in the same tenement shortly before; in one case there had been Typhoid Fever in the same tenement in the previous year, and the possibility of a "carrier" was involved; one had picked rags from ash-pit refuse; in two cases there had been cases of Diarrhæa in the same tenement a few weeks previously, and it is quite possible that these were unrecognised cases of Typhoid; in another case the patient had been handling pit-props coated with river slime; in another case the infection was probably got whilst visiting a friend suffering from the disease, and in another the patient, who was a sea-going Engineer, probably contracted the disease abroad.

Method of excrement disposal for each tenement affected:--

50 by Water Carriage. 10 Conservancy System.

The number of midden-privies, ash-closets, and pan-closets converted into W.C's. during the year was 365.

The Scavenging of receptacles on the Conservancy System is undertaken by the Cleansing Department of the Corporation and is efficiently performed.

It is impossible to give the sources of Shell-fish consumed in the Borough. There are no recognized Vendors, but people gather various shell-fish indiscriminately for their own consumption, from the rocks on the foreshore, the jetties, and from near the sewer outfalls. I have found the sea-water polluted with Bacillus Coli at Roker, at Sea Lane, and at Whitburn, and I consider that it is probable that there may be occasionally Typhoid Bacilli also in the water.

DR. WHEATON'S REPORT ON TYPHOID FEVER IN THE COUNTY OF DURHAM.

On August 4th, 1910, the Medical Officer of Health read a resumé of the above report to the Health Committee, so far as it affected the Borough of Sunderland.

He pointed out that owing to the action of the Health Committee in securing the abolition of so many privy-middens in the

Borough, the attack-rate of Typhoid Fever had considerably fallen, as evidenced by the following Table:—

	Attack-rate of Typhoid Fever
Year.	per 1000 of the Population.
1900	2.08
1901	1.65
1902	1.42
1903	0.81
1904	0.84
1905	0.91
1906	0.87
1907	0.59
1908	0.79
1909	0.60

Dr. Wheaton's figures only included the year 1908. It was to be observed, however, that the attack-rate was still further reduced in 1909 to 0.6 per thousand. (In 1910 the attack-rate was again reduced to the low figure of 0.37 per thousand).

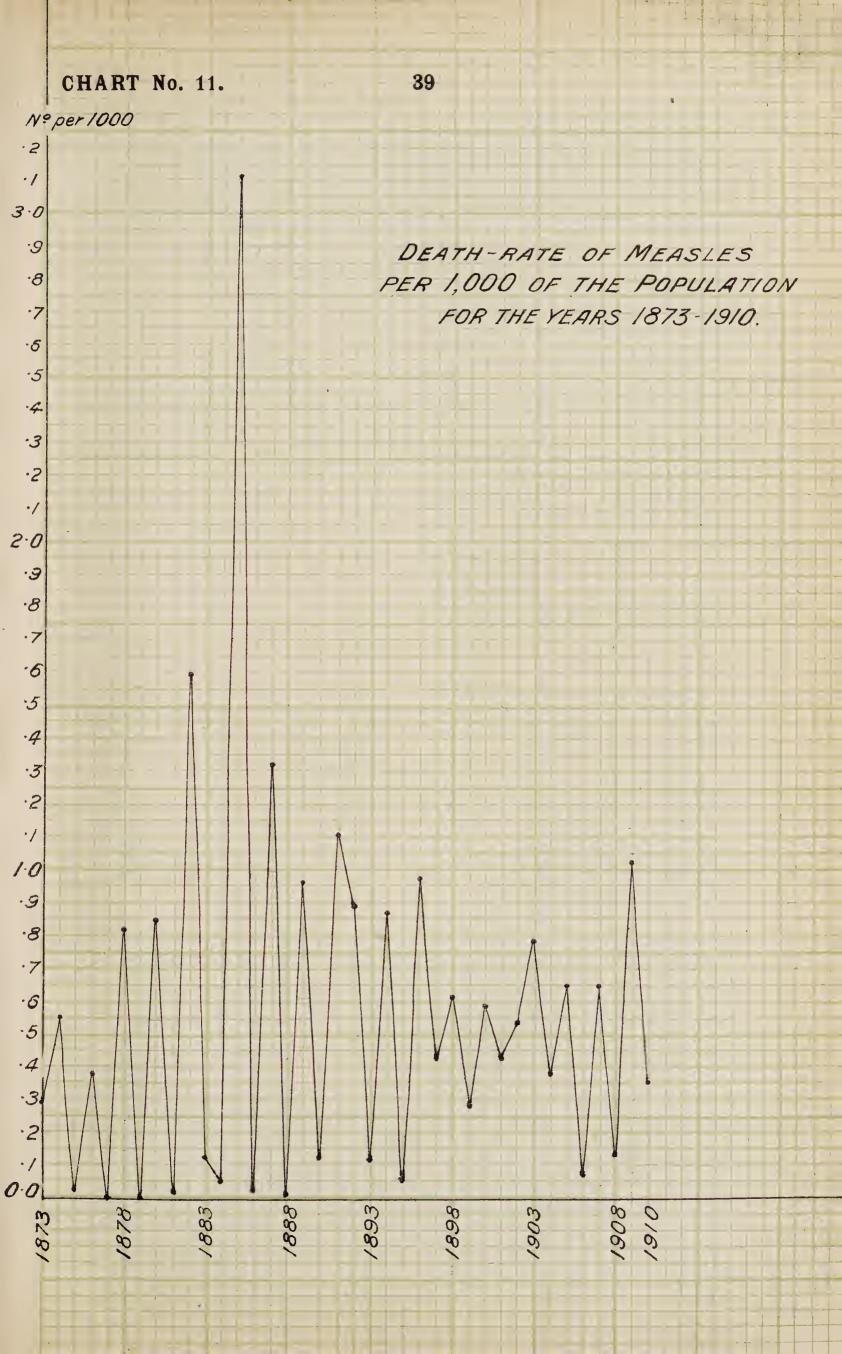

Dr. Wheaton requested that, in order to extend his enquiry, a number of records in relation to Typhoid Fever should be kept. The Committee were informed of these, and the Medical Officer of Health reported that it had always been customary to keep such records in his office.

MEASLES.

There were 701 cases of Measles notified under the Sunderland Corporation Act, 1907, by School Teachers. This number does not represent by any means the total number of cases during the year, as Measles is not a notifiable disease under the Infectious Disease (Notification) Acts, but it is an index to the prevalence of the disease in the Borough. The death-rate per 1,000 of the population due to Measles in 1910 was only 0.36, as against 1.04 in 1909, when we had only 631 cases notified from the Schools. The Chart, No. 11 on page 39, shows the death-rate of Measles per 1,000 of the population for the years 1873 to 1910.

SCHOOL AND CLASS CLOSURE.

Ever since the receipt of the Memorandum by the Local Government Board with respect to class-closure (dated January, 1908, this procedure has been tried wherever possible. In some cases, class-closure failed to cut short the invasion of the School by Measles, because it was found that the first case had not been notified. It is always a difficult matter to be certain that one has got the first case, and it is often found that two or more cases have arisen previously without the fact being known. There is also

 the risk of infection to member of other classes where several classes meet in the playground at the same time. In several instances this was no doubt the cause of the whole Department being affected, and in such cases it was found necessary to advise closure for three weeks. The following Table shows the different Schools affected together with the method of closure adopted:—

NAME OF SCHOOL.		Number of cases of during the year.	Number of Classes closed for five days.	Fresh Cases after Class re-opened.	Whole Department closed for three weeks	Fresh cases after re-opening	
Chester Rd. Infa Thomas St. ,	nts	34 30	l Impracticable on account of number of		from Nov. 9	None.	
Colliery Hudson Rd.	,,	21 47 66 33	cases 5 2 5 2	None.	from Mar. 1 from Apr. 20 	None. None. 	
Commercial Rd., Green Ter. Pallion, Gray, C.E. St. Patrick's	;; ;; ;; ;;	37 18 5 33 14 4 47	5 3 3 7 2 2 42 Cases 1 Class	year. None. Yes. None. Yes. None. None	from Apr. 27 from Apr. 4	None None.	
M'kwearmouth,	,,	$21 \\ 22 \\ 9 \\ 39$	(Closed in Decem.) 1 3 6	None. Yes. Yes. Yes.	from Sep. 14 from Mar. 4 from Nov. 25	 None. None. 6 fresh	
Walley Pd	,,	30 79	6	Class V closed for 3 weeks as 15 cases at one time. No fresh cases on	from Sept. 24	cases. None.	
Simpson St. Hylton Rd. Hylton Rd	ts ,,	7 35 37 25 8*	2 6 4 6 	re-opening in any class. None. Yes. None. Yes.	from Dec. 12	None.	

^{*} The Medical Officer of Health was afterwards informed that something like half the children in the Department were absent on account of Measles; the Department was therefore closed for three weeks,

It will be seen from the above Table that Class closure failed to cut short the outbreak of Measles in 10 Infants' Departments out of 23 which were attacked.

Of the ten Departments where total closure was adopted for three weeks, there was only one in which Measles appeared after re-opening, and in that one only to the extent of six cases.

After experience of the two methods my own impression is, that if total closure were adopted as soon as the invasion began, the outbreak might be cut short at once.

INFECTIOUS DISEASES IN SCHOOLS.

Your Medical Officer of Health has prepared a pamphlet, setting forth the leading signs and symptoms of the principal infectious diseases commonly found amongst children, for the use of the teachers in the Council's Schools. This has been done to meet a want often expressed to him by members of the Scholastic Profession. The book was submitted to the School:s' Medical Officer and the Education Committee, and approved by them. Every teacher has received a copy.

DEPUTY MEDICAL OFFICER OF HEALTH.

Dr. Vaux, who has acted in the above capacity for some years, having left the town, Dr. Hubbersty has been appointed to fill the vacancy.

SMALL-POX AND VACCINATION.

Small-pox is certainly likely to become very much more prevalent in this country as time goes on. Scattered outbreaks have been from time to time reported, and but for the viligance and effective administration of the various Health Departments, a general epidemic would have resulted.

This cannot always go on, however. In the midst of a community where the neglect of vaccination is steadily growing year by year, there will come a time when the most efficient Sanitary Staff will fail to retard the advance of this dread disease. This state of things is being gradually, but surely, brought about by the so-called conscientious objector, who can now so easily obtain

an exemption certificate for his child. The following Table shows the number of Certificates of (Conscientious objection) Exemption:—

Year.	Number of Certificates
	obtained.
1900	49
1901	39
1902	40
1903	42
1904	32
1905	53
1906	66
1907	175
1908	372
1909	510
The state of the s	tal1 378

Thus we have an ever increasing number of persons totally unprotected against Small-pox, and a potent source of danger to the rest of the inhabitants.

DISINFECTION OF BOOKS.

A hot-air Steriliser has been placed in the Disinfecting Station at the Borough Sanatorium for the disinfection of Books by dry heat.

REPORT ON CORPORATION PATIENTS SENT TO THE STANHOPE AND WOLSINGHAM SANATORIA.

Since June, 1901, 86 patients have been treated in the Stanhope and Wolsingham Sanatoria as Corporation Patients.

Of these, 55 are dead, 8 are well, 4 fairly well, 3 are ill, 14 cannot be traced, 2 were under treatment at the end of the year.

Of those who died, the average duration of life after discharge from the Sanatoria was $1\frac{3}{4}$ years.

Of the 15 still under observation:-

Two have	been at	work for	$9\frac{1}{4}$ years.
One has b	peen at	work for	$8\frac{1}{2}$ years.
One	,,	,,	$5\frac{3}{4}$,,
One	,,	, ,	5 ,,
One	,,	,,	$4\frac{1}{4}$,,
One	"	,,	$3\frac{1}{4}$,,
One	,,	,,	3 ,,
One	,,	,,	$2\frac{1}{1}\frac{1}{2}$,,
One	,,	,,	$1\frac{1}{1}\frac{1}{2}$ year.
Two have	,,	,,	$1\frac{1}{2}$,,
One has	,,	,,	1 ,,

This is not a very encouraging record, but it must be borne in mind that many of the cases are not in the early stage when admitted, and therefore at the most, one can only hope for arrest of the disease for a few years. But even this is worth while, for it means that the worker is able to maintain himself and family for a much longer time than he would otherwise have been able to do.

It is found that those who are lost sight of are generally the best cases on discharge, some going abroad or removing their homes to other places, and it is probable that the majority are still at work.

The early cases, those in which the disease has just commenced, do exceedingly well, and from 30 to 40 per cent. at least, are alive and working after seven years.

TUBERCULOSIS DISPENSARY.

What is required is some means of getting into touch with the early cases which occur amongst poor people who are unable to afford to pay a doctor and unwilling to appy to the Relieving Officer for an order to see the Poor Law Medical Officer. want has been supplied in several towns by the establishment of a Tuberculosis Dispensary. To this Institution people come to be medically examined for the presence of Consumption, and if this is found, appropriate treatment is advised; the early cases being sent to Sanatoria, the later cases to Hospitals for Isolation; and Educational methods, and those in the last stage, to Homes for the Dying. At the Tuberculosis Dispensary, treatment by tuberculin can be given in appropriate cases, while the patient is still able to work. Such a Dispensary is in touch with the Medical Officer of Health, the Sanatoria, Hospitals, Nursing Associations, Guild of Help, Charity Organisation Society, and every other agency which is at work for the improvement of the public health, Several towns already have such an institution.

BOROUGH SANATORIUM REPORT.

The total number of persons admitted was 299, of whom 23 died, giving a Death-rate of 7.3 per cent.

Of the 299 admitted, 242 were cases of Scarlet Fever, of which 11 died, causing a Death-rate of 4.5 per cent.

57 cases of Enteric and Continued Fevers were admitted. On further observation, 17 of these were found not to be suffering from these diseases.

The diagnoses were as follows:—

Drantana	Number of	Result.			
DISEASES.	Cases.	Cured.	Died.		
Pneumonia	2	2	• • •		
Gastro-Enteritis	1	1	•••		
Meningitis	2	•••	2 .

Influenza	3	3	• • •		
Constipation	2	2	• • •		
	1 residence à despusarion à squarisque de décentral de la constitución				
Totals	17	14	3		

Deducting the above 17 cases, there were 40 cases of Enteric Fever, of which 8 died, representing a Death-rate of 20.0 per cent.

One case of Scarlet Fever was found to have Chicken-pox also; recovery took place.

PORT CASES.

(Included in the above total.)

One case notified as Typhoid, and one case as Scarlet Fever were admitted to the Sanatorium from vessels in the Port.

Table I. shows the number of cases of Infectious Diseases notified during the years 1909 and 1910, together with the number admitted to the Sanatorium, and the percentage of the total cases notified so admitted.

Miss MacRae, the Matron of the Borough Sanatorium, has performed her duties with great ability, tact, and kindness, and I beg to acknowledge my indebtedness to her.

I wish to thank also the Nursing Staff for their assistance in the Wards.

BACTERIOLOGICAL REPORT.

The following is a Report of the Bacteriological examinations made by Professor Hutchens during the year 1910:—

DRINKING WATER.

CLASS.	lst Quarter.	2nd Quarter.	3rd Quarter.	4th Quarter.	Totals.	Percer.	1910.
I. Containing no Bacillus Coli in 100 c.c.	28	31	24	17	100	54.7	51.8
II. B. Coli present in 100 c.c.	17	14	23	21	75	37.8	38.9
III. B. Coli present in 10 c.c.	5	2	4	5	16	6.8	8.3
IV. B. Coli present in 1 c.c.	•••	1	•••	1	2	0.7	1.0
Totals	50	48	51	44	193	• • •	•••

On May 5th, 1910, a joint meeting of the Health Sub-Committee (deputed to consider the condition of the water supply) and of a deputation from the South Shields Trade, Commerce and Parliamentary Committee, was held at the Town Hall, Sunderland.

At that meeting, a combined report drawn up by the Medical Officer of Health of South Shields, and the Medical Officer of Health of Sunderland, on the Bacteriological condition of the drinking water supplied to the two Boroughs, was read.

The Medical Officers said that attention was first drawn to the matter in a report from Professor Hutchens, to the Sunderland Health Committee, for the year 1907. There was a Meeting of the Directors of the Water Company held on May 14th, 1908, at which a deputation from the Sunderland Health Committee attended, and the question was discussed. It was agreed that during the next six months the Water Company and the Corporations should give the matter their best attention.

From that time up to the date of the joint meeting with a deputation from South Shields (May 5th, 1910) samples of water had been taken on behalf of the Sunderland Corporation, by the Sanitary Inspectors, every week. The results are shown in the Table below:—

BACTERIOLOGICAL EXAMINATION OF SUNDERLAND AND SOUTH SHIELDS WATER SUPPLY.

Showing the number of samples examined in the years 1907, 1908 and 1909, and the results of such examination:—

YEAR	Total No. of Samples Examined.	Class I. B. Coli absent in 100 c c	Class II. B. Coli. present in 100 c c	Class III. B. Coli present in 10 c c	Class IV. B. Coli present in 1 c c
		Per cent	Per cent	Per cent	Per cent
1907	132	50.0	34.8	12.1	3.0
1908	112	56.2	29.5	10.7	3.5
1909	148	54.7	37.8	6.7	0.7
S. Shield 1909	101	70.0	18:0	12.0	1.0

The South Shields Health Committee caused the water supplied to their Borough to be examined from December, 1908 to November 1909. 101 Samples were taken and sent to Sir Rubert Boyce at the University of Liverpool for bacteriological examination. The results of Sir Rubert Boyce are shown in the above Table, the proportion of good samples being higher than in Sunderland.

Further reports of Professor Hutchens and Sir Rubert Boyce were quoted by the Medical Officers, after which the latter added, that, "considering that the water is derived from a large area in "the County of Durham, at a distance from our districts, and "taking into account the well-known fact that the limestone rock, "from which the water comes, contains many fissures, we are of opinion that the water of each well should be examined, and "we think that the County Council of Durham should be requested to co-operate with these Boroughs (Sunderland and South Shields) in the study of the water supply."

It was thereupon agreed by the joint Committee to request the County Council of Durham to co-operate with the Boroughs of Sunderland and South Shields in the study of the water supply.

The County Council of Durham agreed to such co-operation, and the question is still receiving attention.

EXAMINATION OF MILK FOR TUBERCLE BACILLI.

	lst Quarter	2nd Quarter	3rd Quarter	4th Quarter	Totals
Positive (T. Bacilli Present)	•••	1	1	•••	2
found)	15	19	17	22	73
Totals	15	20	18	22	75

Thus Tubercle Bacilli (germs of Consumption) were found in 2.6 per cent. of the total number of samples examined during the year. In the previous year 7.4 per cent of the total number of samples were Tuberculous.

ACTION TAKEN UNDER SECTION 33 OF THE SUNDERLAND CORPORATION ACT, 1907, PART V., MILK SUPPLY (TUBERCULOSIS).

Two dairymen were dealt with under the above Act during the year 1910. At one farm, three cows were found with signs of a suspicious nature in the udder, pointing to tuberculosis. The farmer attended at a special meeting of the Health Committee, and stated that he was having his cows tested with tuberculin. Five which reacted, and one which was doubtful, were removed from the farm.

At the other farm, all the cows had been bought with certificates to the effect that they had not reacted to the tuberculin test, with the exception of three. Induration of the udder was found by the Corporation Veterinary Surgeon in one of the cows, which had previously passed the tuberculin test.

An offer was made by the Corporation Veterinary Surgeon to re-test this cow, but it was not accepted. The Corporation gave notice to the farmer to attend a special meeting to show cause why an order should not be made on him to cease to supply milk from his dairy, or from any specified cow or cows therein, to the inhabitants of the Borough of Sunderland. The farmer did not appear, and the Corporation made an order, requiring him not to supply within the Borough, any milk from the cow with the induration of the udder, nor from the three untested cows. The suspicious cow was afterwards re-tested by the farmer's Veterinary Surgeon, with a negative result. The Corporation thereupon withdrew the order with respect to this cow. The farmer appealed to the Board of Agriculture and Fisheries against the Order made by the Corporation, and the Board appointed Colquhoun Dill, Esq., Barrister-at-Law, to hear the appeal at the Town Hall, Sunderland.

Subsequently the Board of Agriculture and Fisheries decided to uphold the Appeal with costs.

EXAMINATION	OF	SWABS	FOR.	DIPHTHERIA
	O.L.	O(1)	TUTO	

	lst Quarter	2nd Quarter	3rd Quarter	4th Quarter	Totals
Diphtheria Bacilli found .	48	36	26	30	140
Diphtheria Bacilli not found	135	98	89	73	395
Totals	183	134	115	103	535

The swabs are taken by Medical practitioners from suspected cases of Diphtheria, and from the throats of persons who have been in contact with persons suffering from this disease, who may be "carriers."

A swab is also taken from the throat of every case of Scarlet Fever admitted to the Borough Sanatorium to exclude "carriers" of Diphtheria from the Scarlet Wards. The latter practice was commenced several years ago when the Scarlet Wards were invaded by Diphtheria owing to a patient who was suffering from Scarlet Fever and who also was also a "carrier" of Diphtheria being admitted. 37 "carrier" cases were thus discovered, and isolated, during the year.

The result is that there has not been a single case of Diphtheria in the Scarlet Wards since.

EXAMINATION OF BLOOD FROM PATIENTS SUS-PECTED TO BE SUFFERING FROM ENTERIC FEVER (GRUBER-WIDAL REACTION).

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Totals
Positive	3 11	5 15	20 18	11	39 48
Totals	14	20	38	15	87

I have found this test a very useful aid to the diagnosis of Enteric Fever. During the last five years it has been used for every patient admitted to the Enteric Wards, and I have found that in 95 per cent. of the cases diagnosed as Enteric the Gruber-Widal Reaction was positive.

EXAMINATION OF SPUTUM IN SUSPECTED CONSUMPTION.

	lst Quarter	2nd Quarter	3rd Quarter	4th Quarter	Totals
Tubercle Bacilli present . Tubercle Bacilli not found	11 38	12 30	14 32	11 23	48 123
Totals	49	42	46	34	171

ANALYSIS OF THE DRINKING WATER.

On the 23rd March, 1910, Samples of Water were obtained from the Fulwell and Humbledon Hill Water Works and submitted to the Borough Analysts for chemical analysis. Their Reports are as follows'—

	FULWELL	HUMBLEDON
Total solid matters in Solution, dried at 212° F	. 33.600	38.920 grains per gallon
Chlorine existing as chlorides	. 2.803	3.653 ,, ,,
Ammonia	. 0.002	0.002 ,, ,,
Albuminoid Ammonia	. 0.002	0.002 ,, ,,
Lead and other poisonous metals	None	None
Hardness before Boiling	. 24.4	30.6 Degrees
Hardness after boiling I hour	. 8.6	13.4 ,,

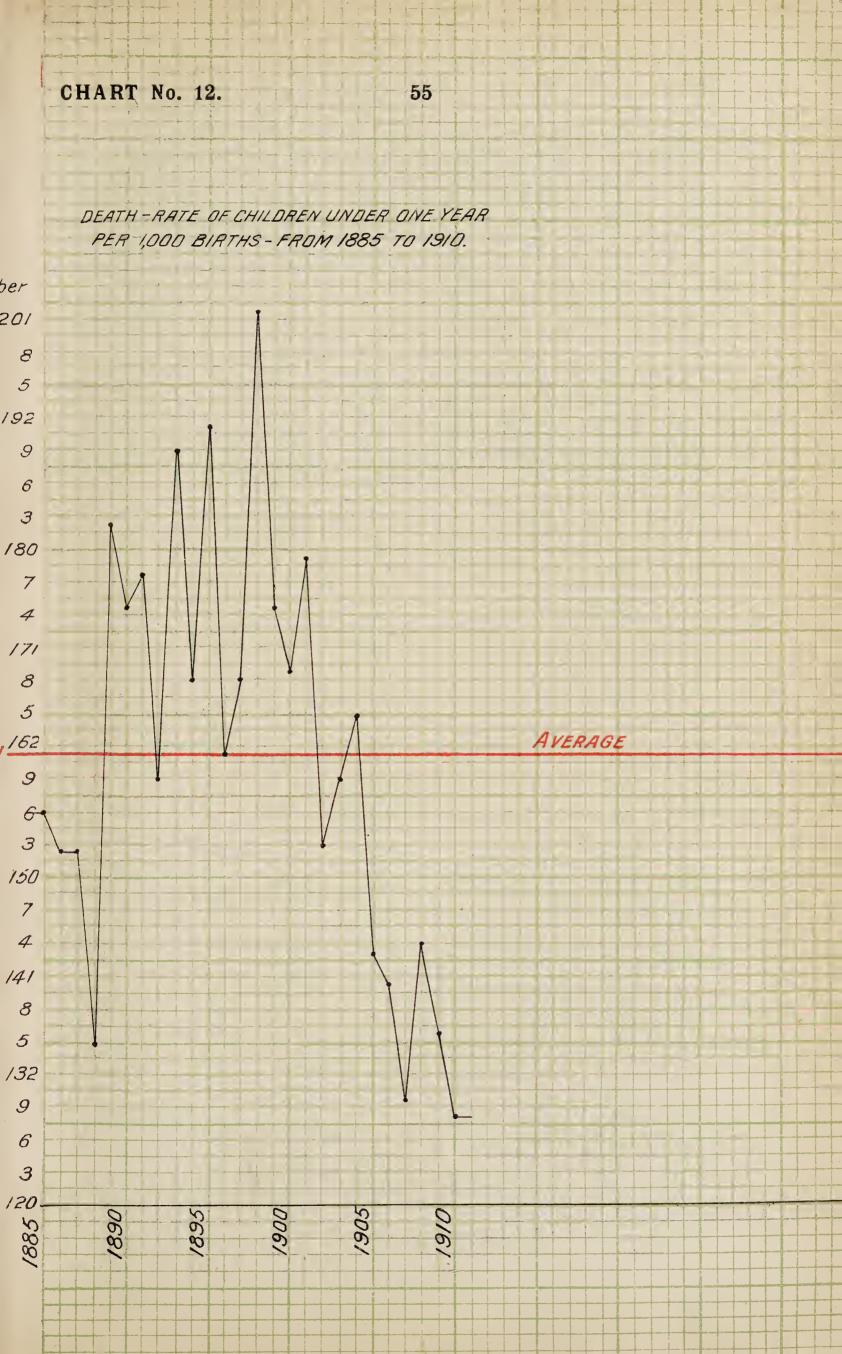

The results of these analyses are very similar, as far as organic matters contained in the waters are concerned, to those yielded by the sample which we analysed for you last June, and by other samples of the Sunderland and South Shields Company's Supply which we have analysed of late years. In this respect the samples are quite suitable for drinking. The "Fulwell" sample is, in respect of the amount of dissolved solids, and of the degree of hardness, about the average of the Company's supply, but the "Humbledon" sample is much harder. The difference between the two is apparently due to sulphates, which cause "permanent" hardness, for the hardness both before and that after boiling are both higher in the Humbledon than in the Fulwell sample by about the same amount.

(Signed) J. and H. S. PATTINSON.

INFANTILE MORTALITY.

The following Table indicates the Infantile Mortality figure in Sunderland contrasted with that of England and Wales from 1885:—

	Infantile Mo Sur	ortalit iderla		
1885		156	••••••	138
1886		152	•••••	149
1887		152	••••••	145

1891)				
1895	,,	177		151
1896 1900	,,	175		156
$1901 \}$,,	160		137
$-\frac{1906}{1910}$,,	135		118

 In the Table on page 54 it will be seen that the infantile mortality figure for 1910 has fallen to 128, being 8 less than in the previous year, and that the average for the last five years has fallen from 160 to 135, a difference of 25.

On reference to Table V., page 90, it will be observed that 588 children died under the age of one year.

Of the 588:-

231, or 39.3 per cent. died within one month from birth.

142, or 24.1 per cent. died within one week of birth.

The following Table shows the *Principal Causes* of death in children under one year of age for 1910, the death-rate per 1,000 children born, and the average death-rate for the last six years:—

INFANTILE DEATHS:—WHOLE BOROUGH.

Cause of Death	Number of Deaths	Death-rate per 1,000 Births	Average Death-rate per 1,000 Births for the last six years
Measles	10	2.1	3.0
Diarrhoeal Diseases	68	14.8	18.4
Premature Birth	94	20.5	19.2
Congenital Defects	20	4.3	4.2
Atrophy, Debility Marasmus .	157	34.2	29.8
All Tubercular Diseases	15	3.2	4.4
Simple Meningitis	12	2.6	2.7
Convulsions	30	6.5	8.9
Bronchitis	78	17:0	19:4
Pneumonia	31	6.7	9.2
Suffocation	9	1.9	1.3
Whooping Cough	19	4·1	5.3
	543	117:9	125.8

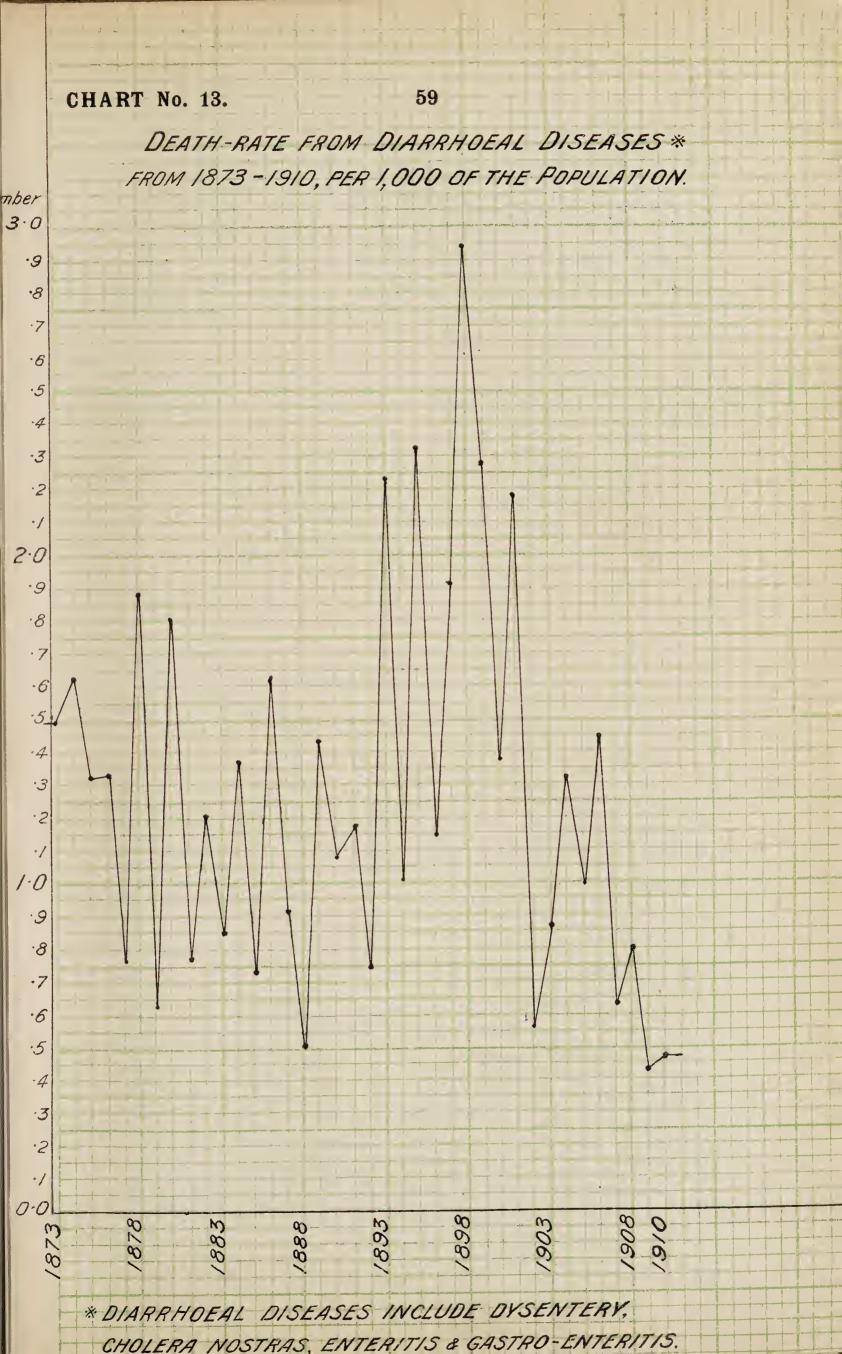

There are practically only two causes of death in the above Table which give a death-rate above the average of the last six years, viz.:—Atrophy, Debility and Marasmus, and Premature Birth.

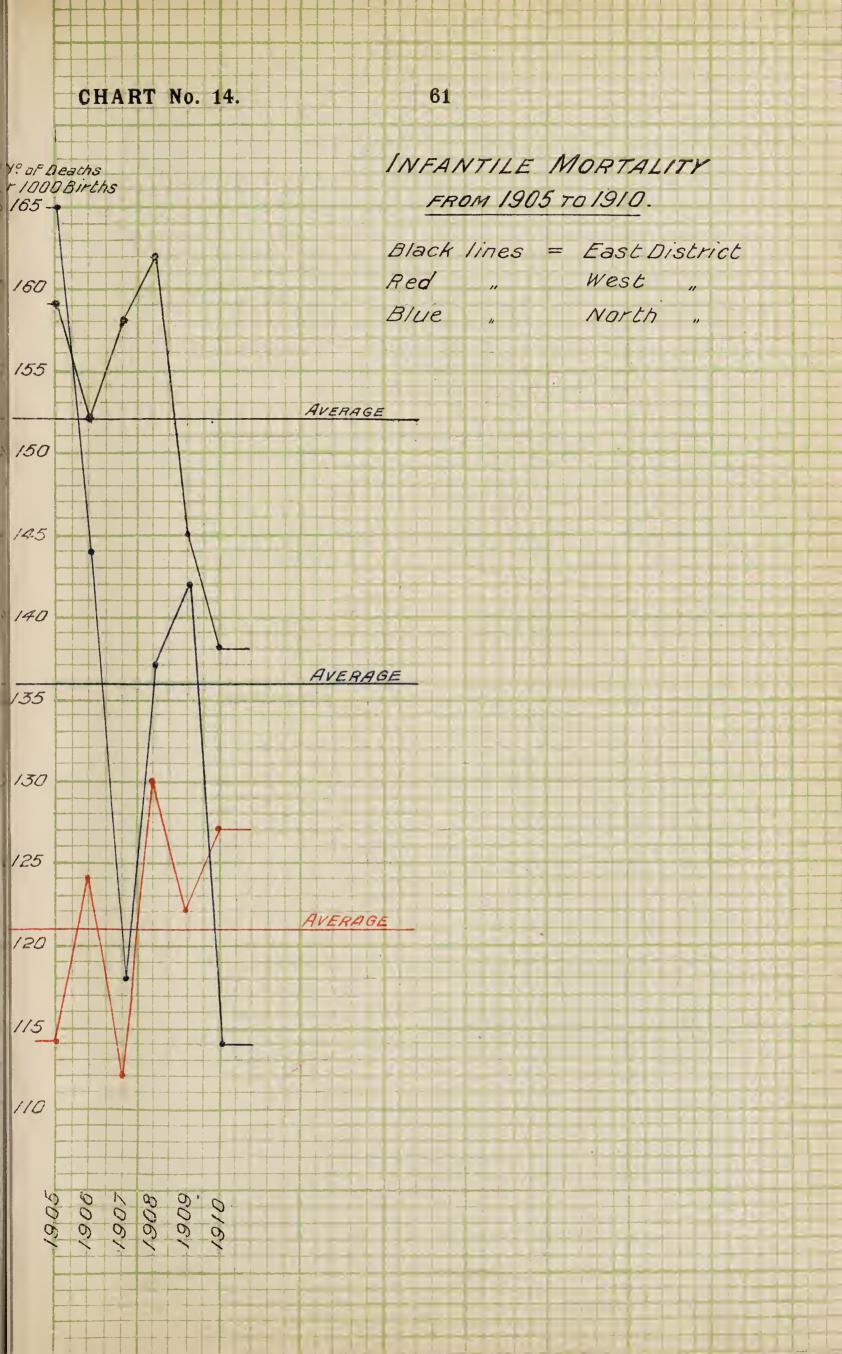

As I have said in previous Annual Reports, there are many causes of Premature Birth, and it is very difficult to come to a definite conclusion in these cases, but speaking generally, poverty, intemperance, work undertaken when the mother is unfit, debility, early-marriage, and certain diseased conditions are the principal factors which make for this state of things. It is probable that abortifacients are used. I have heard it hinted again and again. If this is so, I cannot speak too strongly against such a criminal practice, which having accomplished the desired object, or not, is fraught with disastrous effects to those who use them, effects which frequently cause serious disease and even death.

The deaths due to Atrophy, Debility and Marasmus were no doubt increased in number owing to the poor condition of the mothers during the trade depression of the previous years.

The following Table shows the principal causes of death of children under one year of age, the death-rate per 1,000 children born for the year 1910, and the average death-rate of children under one year, for the last six years, in the East, West, and North Districts:—

	EAST D	ISTRICT	WEST I	DISTRICT	NORTH DISTRICT		
Cause of Death	Death- rate per 1,000 Births	Average Death- rate for last six years	Death rate per 1,000 Births	Average Death- rate for last six years	Death- rate per 1,000 Births	Average Death- for last last six years	
Measles Diarrhœal	2:3	3.8	2.3	2.6	1.7	2.9	
Discases	20.8	21.7	10.4	15.3	12.3	19.5	
Premature Birth.	18.0	19.5	23.2	19.1	20.2	18.9	
Congenital defects		2.8	5.2	5.4	6.1	4.7	
Atrophy, Debility							
Marasmus	29.5	32.0	38.9	30.6	34.3	35.6	
All Tubercular							
Diseases		4.0	4.6	5.4	3.2	3.8	
Simple Meningitis		3.7	0.7	1.2	3.2	3.6	
Convulsions	9.8	12.3	3.4	6.5	6.1	7.6	
Bronchitis	26.6	29.3	13.9	14.0	7.0	11.3	
Pneumonia	6.9	8.0	5.2	8.2	8.8	12.6	
Suffocation (over-laying)	1.1	0.86	2.3	1.8	2.6	1.2	
Whooping Cough	4.0	4.6	5.2	6.6	2.6	4.0	

entis money services

Comparing the three districts with each other, it will be seen that of the preventible causes the West district has the lowest rate for Diarrhæal Diseases, considerably below the average for that district, and even more so below the average for the whole Borough. The East was the worst district. The lowest rate for Premature Birth was in the East district, it was below the average for the Borough, and also below the average for the district. The West district had the highest rate. The East district, again, had the lowest rate for Atrophy, Debility and Marasmus, much below its average-rate, and slightly below that for the Borough. It was decidedly the lowest for All Tubercular Diseases, very much below the average both of the District and the Borough.

The rate for Simple Meningitis was lowest in the West district. The lowest rate for Convulsions was in the North district, which also had by far the lowest rate for Bronchitis. The West district had twice as high a mortality from Bronchitis as the North, and the East more than three times that of the North. Pneumonia, however had the highest rate in the North, and the lowest in the West district.

The mortality due to Over-laying was lowest in the East, higher in the West, and highest in the North district.

It is very interesting to compare the total Infantile Mortality of the three districts. This is graphically shown in Chart No. 14, page 61, where the death-rates are shown in a different colour for each district. The result is very striking, for it will be seen that though the North district was highest six years ago, it is now the lowest; the East, then only slightly below the North, now occupies a position midway between the highest and lowest deathrates for the latter district; whilst the West district which started in 1905 with the low rate of 114 per 1,000 births, now has a deathrate of 127 per 1,000. This increased death-rate among children under one year of age in the West district, appears to be mainly due to Atrophy, Debility and Marasmus, and Premature Birth. The death-rate for Atrophy, etc., in 1910 was 38.9 per 1,000 births, and the average for the last six years was 30.5, the average for the Borough being 29.8 Premature Birth in the West district, caused a death-rate of 23.2 per 1,000 births in 1910, the average for the last six years being 19.1, and that for the Borough, 19.2

The following Table shows the Mortality among children under one year of age per 1,000 births, the average death-rate for the years 1905 to 1910, at different age periods, for the three districts and for the whole Borough:—

	East District.		WEST DISTRICT.		North District.		WHOLE BEROUGH.	
	Death rate per 1000 Births in 1910.	Death rate for last 6	rate per	Death rate for last 6	Death rate per 1000 Births in 1910.		Death rate per 1000 Births in 1910.	Average Death rate for last 6 years.

No. of Births	1724	1920	1721	1957	1137	1198	4582	5076

The fore-going Table shows that on the whole, all the districts are improving, notwithstanding the fact that the Infantile Mortality figure has risen to the extent of 5 per 1,000 births in the West.

East District.—There is improvement in this district at every age period, with the exception of that of 3 weeks and under 4 weeks, and that of 3 months and under 6 months. A very great amount of work is necessary in order to ascertain the cause of increase in Mortality at a given age-period. This has been done in some instances, and it was found that the rise which took place in the East district for the 3 to 6 months age-period, was due principally to Diarrheal Diseases and Bronchitis. There has been a great saving of life in the age-period of 6 to 9 months, and to an appreciable extent in the following period.

West District.—The figures for children under 1 week and up to 3 weeks are not satisfactory. The remaining periods show an improvement on the average, and, on the whole, when compared with the previous year.

NORTH DISTRICT.—The same remarks with regard to the periods up to 3 weeks apply also to this district. In the remaining periods however, there is distinct improvement on the average, and also as compared with the previous year.

Whole Borough.—Here again the figures are above the average for the first three age-periods. The remaining periods show improvement, more especially so in the two last, both on the average and when compared with the previous year.

The Tables for the previous years have not been introduced in order to avoid confusion.

BIRTHS.—It will be observed that the Births are much below the average in the East and West districts, and also in the whole Borough.

HEALTH VISITORS' REPORT.

The following is a summary of the work done by the Health Visitors during the year, compared with the previous year:—

	YEAR 1910.	YEAR, 1909.
Visits to Premises where children suffered from Infectious Diseases	1075	1396
Cases of Puerperal Fever visited (not included in the above)	5	4
Number of Visits to Consumptive Cases (not included in the above)	88	81
Number of Re-visits to Consumptive Cases	379	231
Visits to Infants immediately after Birth	4111	4032
Number of Re-visits to Infants	8490	9645
Visits to houses where Infants had died under the age of one year	521	499
Visits to Boarded-out children, undertaken at the request of the Board of Guardians	69	•••
Visits to Midwives	487	276
Total	15225	16164

THE MIDWIVES ACT, 1902.

Two women were summoned before the Borough Justices for practising as midwives when not registered as such, and were cautioned.

A midwife was reported to the Central Midwives' Board in November, 1909. The case was still pending at the end of that year. She was ultimately struck off the Roll.

At the beginning of the year, 33 midwives sent in notice of intention to practice. Three of these have had hospital training and are certified by examination.

The majority of the midwives are uneducated, but more care is taken than formerly in recording information required in the register of cases. In the case of those quite illiterate this is done by a member of the family.

Several are in poor circumstances and doing but little midwifery; two are doing chiefly monthly nursing.

The Health Visitors, who call frequently to inspect their registers, bags and appliances, find that greater care is taken in keeping them up to the required standard.

Dresses and bodices of washable material are worn by the women, most of whom are clean and tidy in person and surroundings, and, as far as can be ascertained, their mode of practice is fairly satisfactory.

The rule for sending for medical help has been observed more carefully. The following notifications of sending for medical help were received:—

Weakness of Child	5
Congenital Defects	
Fits	1
Stillbirths	28
Premature Birth	
Face Presentation	
Hand Presentation	
Transverse Presentation	
Foot Presentation	
Difficult and Prolonged Labour	28
Placenta Prævia	
Retained Placenta	1

SUNDERLAND CORPORATION ACT, 1907, NOTIFICATION OF BIRTHS.

The Births which took place during the year amounted to 4,454; of these, 4,341 were notified to me under the provisions of the above Act, the number so notified being at the rate of 97.5 per cent.

In the East district 1,694 births occurred, of which 1,648 were notified = 97.2 per cent.

In the West district 1,654 births occurred, of which 1,629 were notified = 98.5 per cent.

In the North district 1,106 births occurred, of which 1,064 were notified $\doteq 96.2$ per cent.

VISIT OF DR. HANCOCK.

On March 19th, 1910, Dr. George C. Hancock, one of the Medical Inspectors of the Local Government Board, commenced an enquiry relative to the administration of the Unsound Food and Foreign Meat Regulations, at the Port of Sunderland, and subsequently to enquire into the method of administration of the Sale of Food and Drugs Acts, and the inspection of foods in the Borough. He visited the Warehouses on the River and at the Docks as well as the Fish Quay, to enquire into the inspection of food brought by ships. afterwards made a very thorough inspection of the Slaughterhouses and Butchers' Shops, and of the Milk Shops in the Borough, and finally of the Farms certified by the Health Committee both within and without the Borough. With the method of the administration of the Foreign Meat Regulations he appeared to be quite satisfied, and he also expressed approval of the condition of the Certified Farms. He reported, as one expected, most unfavourably with regard to many of the Slaughter-houses, which are disgraceful.

For a long time previous to Dr. Hancock's visit, the Chief Sanitary Inspector had been preparing a Report on the condition of all the Butchers' Shops and Slaughter-houses in the Borough. Every one of them was inspected by him and all those in bad condition, conjointly by him and myself. This Report has received very full consideration by the Health Committee; new Regulations have been drawn up and await the approval of the Local Government Board, after which there will no doubt, be a great improvement in the Shops and Slaughter-houses.

LOCAL GOVERNMENT BOARD ORDER, DATED NOVEMBER 10TH, 1910, AS TO PLAGUE INFECTION.

The contents of this Order were read to the Health Committee on November 24th, 1910, when the Medical Officer of Health reported that he had given instructions to all the Sanitary Inspectors of the Borough and of the Port, to keep a look-out for any unusual mortality among rats, and to report to him at once, should they have reason to suspect the presence of disease among rats.

Increased vigilance has been exercised, but no dead rats have been found, nor any suspicion of disease.

HOUSING, TOWN PLANNING, ETC., ACT, 1909.

An extensive List has been prepared of houses which in the opinion of the Medical Officer of Health, an early inspection is desirable, and numerous inspections have been made.

During the year, the Medical Officer of Health reported that 36 houses were unfit for human habitation, and Closing Orders were made under Section 17 of the above Act. The working of the Act has proceeded smoothly, and has resulted in much improvement of the Sanitary condition of the houses already. At the end of the year, in no case was the work quite completed, so that determining Orders could not be made.

NEW HOUSES.

The following is the Report of the work performed by the Inspector of Drains and Sanitary Fittings in New Houses during the year:—

Number of visits made Number of Tests applied to Drains	4,454	
and Sanitary Fittings—		
Water Tests	1,587	
Smoke Tests	110	
Total	1,697	
Number of Certificates sent to the	1,007	
Borough Engineer	90	
Number of cases where it was found		
necessary to order concrete found-		
ations for drains	561	
Approximate length of drains laid	20.003	fe

THE HARRISON BUILDINGS.

The Seventh Annual Report of the Harrison Buildings, made by the Superintendent, Mr. Joseph D. Ward.

On December 31st, 1910, there were 17 houses occupied, viz., 9 consisting of three rooms, and 8 consisting of two rooms each. Sixty-seven houses were unoccupied, viz., 27 of three rooms, and 40 of two rooms each. Out of a total of 84 houses 67 are vacant, as against 46 at the end of 1909.

The rent collected during the year amounts to £289 7s. 3d., compared with £403 5s. 0d., in 1909, a decrease of £113 17s. 9d., making the total amount of rent collected since the houses were opened to be £4,443 12s. 8d.

The arrears of rent amounted to £19 15s. 6d. as against £20 6s. 10d. for last year, a decrease of 11s. 4.d

The total irrecoverable arrears of rent since the Buildings were opened amounts to £37 19s. 6d., or a fraction over 2d. for every sovereign collected.

The following Table shows the amount of rent collected for each year, and the arrears of rent:—

Year.	Rent	Coll	.ecte	d.		Ar	rea	rs.	
*1903		s. 0				£	s.	d.	
1904	492	6	7			0	17	6	
1905	709	4	3			3	9	3	
1906	889	15	0			1	13	0	
1907	867	16	3			8	14	8	
1908	726	17	5		;	33	9	1	
1909	403	5	0		2	20	6	10	
1910	289	7	3			19	15	6	
Totals	£4443	12	8						

^{*} The buildings were opened in September, 1903.

Of the 17 tenants at present occupying houses:—

5	have	been	in	for	7	years.
4	,,		,,		5	,,
	has		,,		3	,,
2	have		,,		2	,,
3	,,		,,		1	year
2	,,		un	der	1	year.

There have been 3 Births and 2 Deaths (1 from Consumption and 1 from Cancer) during the year 1910.

There were only two cases of Infectious Disease during the year, both being Typhoid Fever. The patients were two brothers, one 11 years of age and one 9, and both had been eating raw mussels gathered from the river bed near the foot of the Long Bank, High Street East. They were removed to the Borough Sanatorium, and eventually recovered.

The population of the houses at the end of 1910 numbered 84 persons, an average of a little under two persons to every occupied room.

The following Table shows the population, number of Births, Deaths, and cases of infectious Disease occurring since the opening of the Buildings:—

Year.	Population.	Births.	Deaths	Infectious Diseases.
1904	234	10	4	Nil.
1905	305	15	4	Nil.
1906	335	17	7	. 12
1907	286	20	4	4
1908	190	14	2	Nil.
1909	182	11	3	1
1910	84	3	2	2

The Medical Officer of Health wishes to add that the Superintendent has performed his duties in his usual conscientious and efficient manner.

HOME-WORK.—CONTINUED.

* If an occupier gives out work of more than one class specified in column 1, and subdivides his list in such a way as to show the number of workers in each class of work, the list should be included among those in column 2 (or 5 as the case may be) against the principal class only, but the outworkers should be assigned in columns 3 and 4 (or 6 and 7) into their respective classes. A footnote should be added to show that this has been done.

duty of sending two lists each year and 4 are the total number of the lists received from those employers who comply strictly with the statutory as there will be two lists for each employer—in some previous returns odd numbers have been inserted. The figures in columns 3 and 4 will usually be (approximately) double of the number of individual outworkers whose names are given, since in the February and August lists of the same employer the same outworker's name will often be repeated.

‡ In view of the wide discrepancies found to exist between the totals in the two columns when the returns are added together, it is desired that care may be taken to give exact figures. Only those addressed should be counted which have actually been received from or forwarded to other Councils during the year covered by the report.

JOHN PATTINSON, J. T. DUNN,

Public Analysts.

CONCLUSION.

I wish to thank my colleagues in the other Departments of the Corporation for their assistance so freely extended to me during the year, also the Chief Constable, the Clerks to the Justices of the Peace for the County and Borough, the Clerk to the Guardians, the Head Teachers of the Council Schools, and the Vaccination Officers.

I acknowledge with thanks the many courtesies I have received from the Medical Officers of Health of other towns.

My thanks are due also to Chief Inspector Pennock and to the whole of the Staff of the Health Department, who have worked with admirable zeal in the administration of the work.

HENRY RENNEY, M.D., B.S., D.Hy., D.P.H. Medical Officer of Health.

May, 1911.

^{*} Rates calculated per 1,000 of estimated population.

Note.—The Deaths to be included in Column 7 of this table are the whole of those registered during the year, as having actually occurred within the district or division. The Deaths to be included in Column 12 are the number in Column 7, corrected by the subtraction of the number in Column 10 und the addition of the number in Column 11.

By the term "Non-residents" is meant persons brought into the district on account of illness, and dying there; and by the term "Residents" is meant persons who have been taken out of the district on account of illness, and have died elsewhere.

Notes.—The localities adopted for this table should be the same as those in Tables II. and IV.

State in space below the name of the isolation hospital, if any, to which residents in the district, suffering from infectious disease, are usually sent, and the accommodation, available for the district, afforded by it. Mark (H) the locality in which it is situated, or if not within the district, state where it is situated, and in what district. The name of the authority by whom the hospital is provided should also be

given. Mark (W) the locality in which a workhouse is situated.

* This space may be used for record of other disease the notification (compulsory or voluntary) of which is in force in the district.

† These age columns for notifications should be filled up in all cases where the Medical Officer of Health, by inquiry or otherwise, has obtained the

necessary information.

*** Column 8 should be filled up with the Totals of cases removed to Hospital, whether the District is divided into separate localities or is treated as one undivided area.

Isolation Hospital.—Name and Situation, Borough Sanatorium for Infectious Diseases, Ford, provided by the Corporation of the County Borough of Sunderland. Total available beds, 90. Number of Diseases that can be concurrently treated, 3.

- NOTES TO TABLES IV. AND V.

 (A) In Table IV., all deaths of "Residents" occurring in public institutions, whether within or without the district, are to be INCLUDED with the other deaths in the columns for the several age groups (columns 2-8). They are also, in columns 9-15, to be INCLUDED among the deaths in their respective "Localities" according to the previous addresses of the deceased as given by the Registrars. Deaths of "Non-residents" occurring in public institutions in the districts are in like manner to be EXCLUDED from columns 2-8 and 9-15 of Table IV.
- See notes on Table I. as to the meaning of "Residents" and "Non-residents," and as to the 'Public Institutions" to be taken into account for the purposes of these Tables. The "Localities" in Table (B) IV. should be the same as those in Tables II. and 111.
- All deaths occurring in public institution ssituated within the district, whether of "Residents" or of "Non-residents," are, in addition to being dealt with as in note (A), to be entered in the last column of Table IV. The total number in this column should equal the figures for the year in column 9, Table I.
- The total deaths in the several "Localities" in columns 9-15 of Table IV. should equal those for the year in the same localities in Table II., sub-columns c. The total deaths at all ages in column 2 of Table IV. should equal the gross total of columns 9-15, and the figures for the year in column 12 of Table I.
- Under the heading of "Diarrhœa" are to be included deaths registered as due to Epidemic diarrhœa, Epidemic enteritis, Infective enteritis, Zymotic enteritis, Summer diarrhœa, Dysentery and Dysenteric diarrhœa, Choleraic diarrhœa, Cholera (other than Asiatic or epidemic) (E) and Cholera Nostras.
- Deaths from diarrhœa secondary to some well defined disease should be included under the latter.
- Deaths from Enteritis, Muco-Enteritis, Gastro-Enteritis, and Gastritis (see under the heading Diarrheal Diseases in Table V). in Tables IV. and V. should be placed immediately below ,but separately from, those enumerated under the heading Diarrhœa as defined by enumeration above. This is particularly important for deaths under one year of age, as many of the deaths in infancy returned as due to Enteritis are really caused by Epidemic Diarrhoea. In the course of years, by the adoption of this recommendation, it will be practicable to ascertain the probable amount of transfer between these different headings.
- Under the headings of "Cancer" and "Puerperal fever" should be (F) included all registered deaths from causes comprised within these general terms. Thus Under "Cancer" should be included deaths from Cancer, Carcinoma, Malignant disease, Scirrhus, Epithelioma, Sarcoma, Villous tumour, and Papilloma of bladder, Rodent ulcer. Under "Puerperal Fever" are to be included deaths from Pyæmia, Septicæmia, Sapræmia, Pelvic peritonitis, Peri, and Endo-Metritis occurring in the Puerperium.
- Under "Congenital Defects" in Table V. are to be included deaths from (G) Atelectasis, Icterus neonatorum, Navel hæmorrhage, Malformations and Congenital hydrocephalus.
- Under "Tuberculosis Meningitis" are to be included deaths from Acute (H) hydrocephalus.
- Under "Other Tuberculous Diseases" are to be included deaths from (I)Tuberculosis, Tuberculosis of bones, joints and other organs, Lupus and Scofula.
- All deaths certified by registered Medical Practitioners and all Inquest (J) cases are to be classed as "Certified"; all other deaths are to be regarded as "Uncertified". B. 4

Annual Report of the Chief Sanitary Inspector.

Health Office,

Town Hall,

Sunderland,

May, 1911.

To the Chairman and Members of the Health Committee.

Gentlemen,

I have the honour to submit to you my Sixteenth Annual Report, wherein you will find detailed information of the work performed by the Sanitary Inspector's Staff during the year 1910.

INSPECTIONS.

Visits for the purpose of inspecting dwelling houses (including tenemented houses) number 32,603. Infectious Diseases Notifications occasioned 735 visits. Factories, Workshops, Workplaces, Domestic Workshops and Outworkers dwellings necessitated 3,161 visits. Further visits of inspection include—to Bakehouses 567, to Dairies, Cowsheds, and Milkshops 1,566, to Slaughter Houses, Butchers, Greengrocers, Fishmongers' Shops, and Provision Stores 6,469, and to Common Lodging Houses, 411 visits. Care and discretion is used in respect to business premises, to avoid undue officiousness on the one hand, and on the other to maintain an efficient measure of inspection, methodical and comprehensive.

For consultative appointments to meet owners, agents, and building tradesmen, to give advice as to sanitary repairs and alterations, 600 visits have been made.

The number of inspections made to premises while work was in progress, total 6,631, and 3,691 calls in quest of information, service of notices, etc., were made.

During the year the total number of inspections made number 60,827 (see Table I.)

NUISANCES.

Under the various Public Health Acts, Bye-Laws, and Regulations, notices numbering 11,280 have been served. Of these, 9,290 were Intimation Notices and 1,990 were Statutory Notices. Careful and systematic inspection of the Borough is regularly made. Nuisances are frequently abated on the Inspector personally drawing the owner's attention thereto. (See Tables II. and III.)

OVERCROWDING.

The amount of overcrowding which would justify legal proceedings is again practically nil; 35 notices have been served but no difficulty was experienced in obtaining compliance, they were resultant conditions of unemployment, for there has been no recent lack of housing accommodation within the Borough.

DRAIN TESTING.

By complaint or request, the drains of 55 dwelling houses have been tested, 13 were defective. On suspicion of nuisance, 100 drains were tested, and 44 found defective. After cases of Enteric Fever or Diphtheria the drains and sanitary fittings of 151 houses were tested, 20 proving defective. 953 new drains were tested under water pressure; the total number of drains tested with water, smoke, or chemical grenades was 558. (See Table V.)

COMPLAINTS.

The total number of complaints received at the Office either verbally or in writing was 255; many of these on investigation proved to be groundless.

STRUCTURAL ALTERATIONS.

Privies and ashpits were abolished in 376 cases, and 365 water-closets and moveable ashpits substituted. 295 broken or otherwise defective W.C. basins were replaced by new wash-down pedestal basins; 19 ashbins out of repair were replaced by new ones; drains of 376 premises were either repaired or relaid; bath, sink or lavatory waste pipes were in 123 cases renewed; new earthenware drain pipes were laid or relaid with four inch pipes to a total length of 11,082 feet; also 626 feet of 6 inch pipes. Defective soil and ventilating shaft pipes were replaced by 3,908 feet of heavy cast iron pipes. (See Table IV.)

INFECTIOUS DISEASES.

It is again a matter of satisfaction that no case of small-pox was notified in the Borough during the year, the contacts visited having had communication with the disease in outside districts.

In consequence of the prevalence of Measles, and the closing of Infant Schools, 42 Class Rooms and 13 Cloak Rooms were disinfected by Officials of the Health Department. (See Tables I. and VII.)

TENEMENTED HOUSES.

As is usually the case, a large number of visits, viz.: 20,193 have been made to this class of property; constant supervision is necessary of tenements, mostly old property, where three and more tenants are housed. 5789 notices were served on tenants to limewash yards, passages, etc. used in common, and 574 notices have been served on owners to limewash tenemented premises

DAIRIES, COWKEEPERS, AND MILKSHOPS.

There are 11 Cowkeepers within the Borough, two less than last year, the approximate number of cows being 171.

The milk register records the names of 558 persons registered for the sale of milk; these have been regularly visited, the number of inspections amounting to 1,341. Notices occasioned by infringements of the Regulations were served on 108 milk-dealers besides a number of verbal notices, which were, as a rule, promptly attended to. In two cases it was found necessary to take out summonses for breach of the Regulations. One was fined 10/-, the other dismissed. In three cases where Infectious Diseases was notified as occurring on premises used for the sale of milk, the sale was discontinued pending the removal or recovery of the patient, and the subsequent disinfection of the premises. (See Table VIII.)

SLAUGHTER-HOUSES AND BUTCHERS' SHOPS.

The Slaughter-houses and Butchers' Shops have been regularly inspected, 5,635 visits having been made thereto, and 834 inspections were made of Fish, Fruit, and Provision Shops.

The Report on Slaughter-Houses in the Borough, referred to in my Annual Report of last year, is still under the consideration of the Sub-Committee. It is expected a solution of this matter will be reached in a short time; when this is done, it will be possible to give better supervision to the slaughtering of animals for food. It is gratifying that the Master Butchers give every assistance in cases where they have reason to suspect that any animal slaughtered is of doubtful condition as to its fitness for food. The fact that 37 carcases of beef, and 10 carcases of pigs, which were condemned as unfit for food, were all surrendered without the necessity of obtaining a Magistrate's Order for their destruction, speaks for itself. (See tables I. and VI.)

COMMON LODGING HOUSES.

Accommodation for 821 lodgers is provided by the 19 Common Lodging Houses in the Borough. This is one house less and six lodgers less than last year. These houses have been regularly visited, and found to be in good order. (See Table XI.)

OFFENSIVE TRADES.

There are 172 premises on which offensive trades are carried on. They are subjected to careful supervision

FACTORIES AND WORKSHOPS.

There are 253 registered Factories in the Borough. In order to bring several Factories and Workshops into compliance with the Sanitary Accommodation Order, 1903, notices have been served resulting in the provision of twelve sanitary Conveniences. Also on the register we have 547 Workshops, 114 Workplaces and 147 Domestic Workshops. (See Tables XVI. and XVII.)

OUTWORKERS.

Ninety circular letters were despatched to firms requesting them to forward lists of Outworkers to this Department; thirtytwo reports to H.M. Factory Inspector, eight to other Authorities, and one to the Home Office. (See Table XVIII.)

ANALYSIS OF FOOD, DRUGS AND WATER.

Of the Samples taken during the year, 216 were formal and 119 informal purchases made under the "Sale of Food and Drugs Act," and 261 samples of water and milk were obtained for the purpose of Bacteriological Examination. (Detailed results will be found in the Medical Officer of Health's Report).

With respect to the samples taken under the "Sale of Food and Drugs Acts," twelve were the subject of legal proceedings, details of which will be found in Tables 19, 20 and 21.

CLERICAL WORK.

164 persons were reported to the Health Committee for non-compliance with notices served upon them in respect to abatement of nuisances; in each instance the Committee authorised proceedings to be taken; intimation to that effect was given to the persons

responsible, and only in nine cases was the issue of summonses necessary. (For results of proceedings see Table 19). 754 letters and 387 circular letters were forwarded with respect to matters in connection with routine office work, and in addition the following circular letters notifying the occurrence of Infectious Diseases in dwelling houses were forwarded as follows:—

To the	Royal Infirmary	107
,,	Eye Infirmary	52
,,	Monkwearmouth Hospital	52
,,	Public Libraries	208
,,	Private Libraries	312
,,	Laundries	1040
,,	Day Schools	687
,,	Sunday Schools	

The clerical work of the Office has a constant tendency to increase. The coming into operation of "The Town Planning Act" last year meant a considerable addition of itself, to the already large amount of clerical work which this Office has to contend with.

SANITARY CONVENIENCES.

I have inserted figures (Table 22) giving the number and description of Sanitary Conveniences in use within the Borough. From these figures it will be seen that 75.75 per cent. of the dwelling houses are provided with the Water carriage system of sewage disposal.

The remaining 24·25 per cent. are on the Conservancy system, for although there are 2·35 per cent. provided with Water closets, they also have a privy and must therefore be classed with the Conservancy system; 2·09 per cent. have open midden privies; 18·72 have covered midden privies; whilst 1·09 per cent. have pan privies.

Table (XXIII.) shows the type of Convenience with which the Factories and Workshops are provided, excepting domestic and other Workshops, which are included in table XXII. It is proposed to deal with four of the above-mentioned Ash Closets at an early date, the other four remaining, as there is not a sewer available. With regard to the privies erected over manure pits, the excremental matter is covered by manure from the Stables, and the contents of the pits are removed without any nuisance being caused by such removal. (See Tables XXII. and XXIII.).

HOUSING AND TOWN PLANNING ACT.

In connection with the above Act, a number of dwelling houses, comprising 987 tenements and 1442 dwelling rooms, have been inspected in detail, the information obtained recorded and tabulated for future use. Thirty-six Closing Orders have been made in respect of this number of dwelling houses, prohibiting the use thereof for human habitation until, in the opinion of the Council, the said dwelling houses have been rendered fit for human habitation; repairs and alterations are in progress in the majority of them.

I have again the pleasure to acknowledge with thanks the loyal and hearty manner in which my deputy, Mr. J. S. Watson and the Staff generally, have supported me in carrying out the work of the Department. It is only by such co-operation and mutual understanding, that we are able to discharge our duties with a minimum amount of friction, with the public.

I am, Gentlemen,
Your obedient Servant,
JOHN PENNOCK,
Chief Sanitary Inspector.

May, 1911.
